DAY 1, PART 6

Visualisation of structures with Mol*

Diana Rapota, Rok Breznikar, Janani Durairaj

23-24 June 2026

Mol* introduction

Mol* website – molstar.org

Alternatively, use PyMOL or Chimera

Mol* (*'molstar'*) is a modern web-based open-source toolkit for visualisation and analysis of large-scale molecular data

[Open Mol* Viewer](#)

[Viewer Documentation](#)

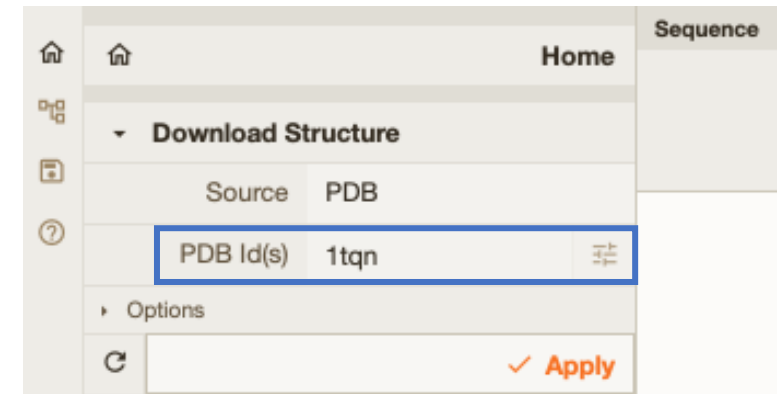

[Issues & Feedback](#)

High-performance graphics and data handling of the Mol* Viewer allow users to simultaneously visualise up to hundreds of (superimposed) protein structures, play molecular dynamics trajectories, render cell-level models at atomic detail with tens of millions of atoms, or display huge models obtained by I/HM such as the Nuclear Pore Complex.

Let's get familiar with basic commands in Mol*

Go to Mol* Viewer and upload the suggested structure from the PDB

Mol* tutorial with the exercises are on the course website

The project is an open collaboration started by

Mol* introduction

Reset View

Press *t*

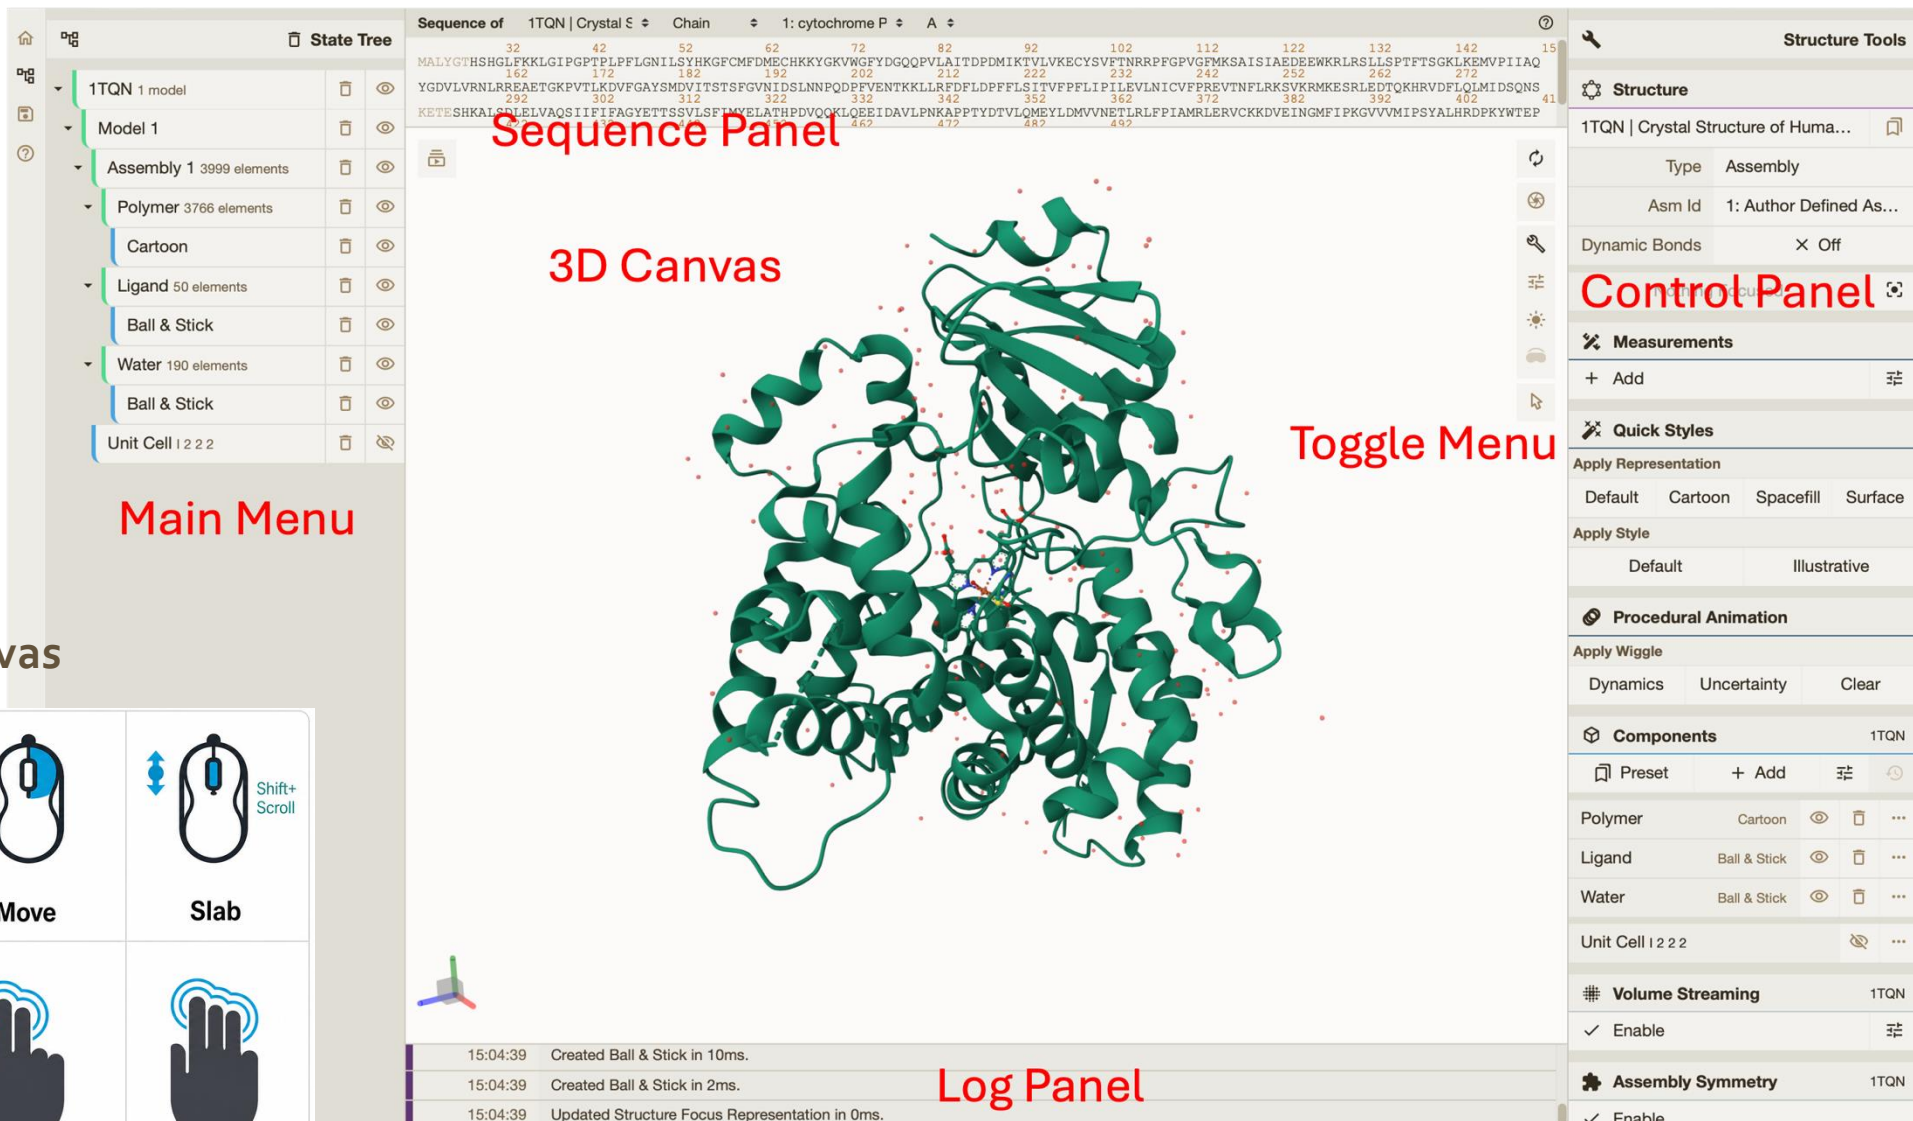

Spin Animation

Press *i*

(to disable press *i* again)

To Navigate the 3D Canvas

 Left Click	 Scroll	 Right Click	 Shift+ Scroll
Select/Rotate	Zoom	Move	Slab
			
			

The screenshot displays the Mol* interface with several key components highlighted in red text:

- Sequence Panel:** Located at the top, it shows the amino acid sequence of the protein (1TQN) in a ribbon representation.
- 3D Canvas:** The central area where the protein structure is visualized as a green ribbon.
- Control Panel:** On the right side, it provides various settings for the structure, including representation type (Cartoon), style (Default), and animation options.
- Main Menu:** On the left side, it lists the components of the assembly, such as Model 1, Polymer, Ligand, and Water.
- Toggle Menu:** A vertical menu on the right side of the 3D canvas, used for switching between different views and styles.
- Log Panel:** At the bottom, it shows a log of recent actions, such as "Created Ball & Stick in 10ms."

Structure Alignment

What is Structural Alignment?

Structure alignment establishes residue-residue correspondences between macromolecular structures based on optimal superposition of their 3D conformation

When is Structure Alignment useful?

- Structure is more conserved than sequence → alignment helps detect evolutionary relationships where sequence-based methods struggle due to low sequence identity
- Pairwise comparison reveals conformational changes upon ligand binding
- Analysis of structural variation within evolutionary families and identification of common structural domains
- Determining prediction quality

High structural similarity

PDB ids: 4S35,1NMY

TM-score: 0.82

Sequence identity: 28%

Structure Alignment

In Mol* there two options for structural alignment:

RMSD-based Superposition – rigidly rotates and translates one structure onto another to minimize the RMSD of paired atoms, sequence-guided

RMSD-score: good value ~ 2 Å or less, protein length dependent

TM-align Superposition – sequence-independent alignment algorithm

TM-score: protein length independent, only aligned residues included

Scores < 0.2 usually indicate that the proteins are unrelated while those > 0.5 generally have the same protein fold

Mol* Exercises

Exercise 1 (together)

Superpose human myoglobin (PDB ID: **1MBO**) to one of the chains of hemoglobin (PDB ID: **4HHB**).

Exercise 2

Superpose the best model for PIGU protein to PIGU protein in the glycosylphosphatidylinositol (GPI) transamidase complex (PDB ID: **7W72**)
